
Bone Voyage' Administering ALS Medications via the Intra- Osseous Route

▶ Jon Jui MD, MPH

▶

Do ALS Medications lead to Improved Survival in Out of Hospital Cardiac Arrest?

Intravenous drug administration during out-of-hospital cardiac arrest: a randomized trial

Compared with patients who received ACLS without intravenous drug administration following out-of-hospital cardiac arrest, patients with intravenous access and drug administration had higher rates of short-term survival with no statistically significant improvement in survival to hospital discharge, quality of CPR, or long-term survival.

MCEMS Cardiac Arrest

- ▶ Does the **combination** of recent changes in resuscitation techniques lead to increased survival of patient presenting with cardiac arrest?

MCEMS Changes in Resuscitation Management 2008-2009

- ▶ CPR
 - ▶ Aggressive continuous CPR including following ETCO₂ during CPR
 - ▶ Asynchronous ventilation via King Airway /ET tube
- ▶ Medications
 - ▶ EZIO
 - ▶ Vasopressin/Epinephrine
- ▶ Induced hypothermia in area hospitals

Data source

- ▶ Data presented is primarily from 2 sources, MCEMS AMR dataset and the ROC Epistry. (Resuscitation Outcomes Consortium)

Multnomah County EMS. Oregon City of Portland and Gresham

- ▶ Population 700,000
- ▶ Single 911 Dispatch Center (Fire/EMS)
- ▶ ALS Fire first response :
 - ▶ 7 minutes 90%
- ▶ Single 911 EMS (AMR) :
 - ▶ 8 minutes 90%
- ▶ Bystander CPR
 - ▶ 30%

MCEMS Cardiac Arrest : January to October 2009 **Field Disposition**

	Number	Percent
Dead at Scene No resuscitation	152	28%
Dead at Scene Resuscitation Terminated	115	21%
Transported	278	51%
Total	545	100%

Clarification: Definitions

- ▶ Initial Presenting Rhythm
 - ▶ **Initial Rhythm** of the patient upon arrival of Fire/EMS
- ▶ Initial arrest rhythm
 - ▶ Presenting **cardiac arrest** rhythm
 - ▶ (VF/VT, PEA, Aystole)

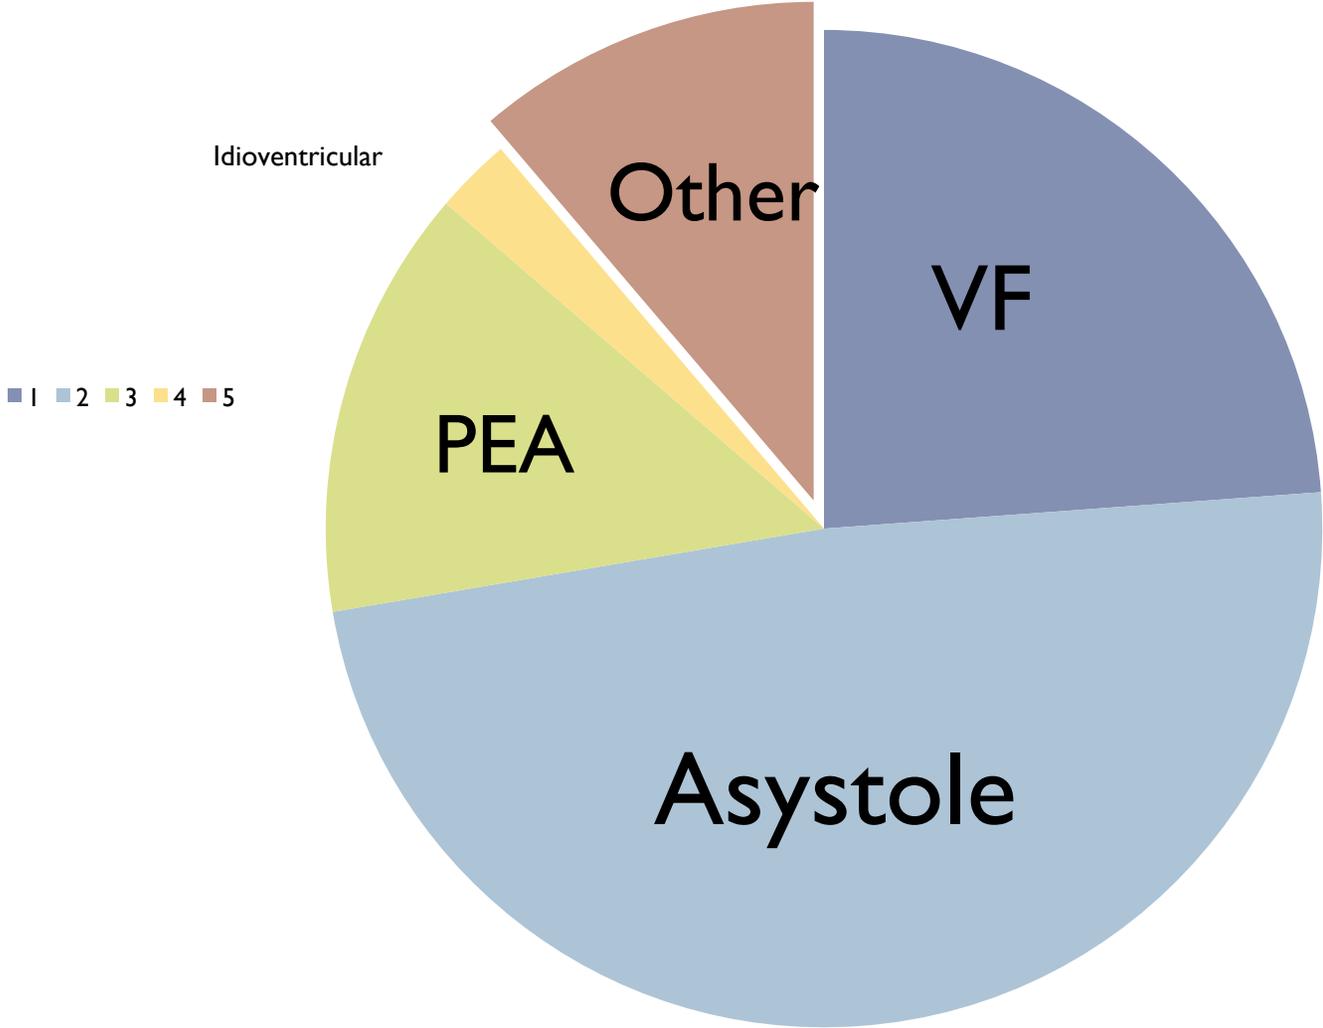

Definition

- ▶ “Organized rhythm”
 - ▶ Narrow QRS (< 0.120)
 - ▶ E.g. (normal sinus, sinus tachycardia, bradycardia, AF, nodal rhythms).

Multnomah County EMS Initial Rhythm Presentation

Cardiac Arrest ALS procedures

Procedure	Number
Advanced Airway	296
EZIO	160
Medication	338
Total	393

Survival by Initial Presenting Rhythm

Totals	68	66	19	12	29	6	42%

Survival of “Organized Rhythm”

Survival of “Organized rhythms” which changed to VF/ VT

- ▶ 68 patients in our cardiac arrest cohort
- ▶ 27 of the 68 patients (39%) were defibrillated.
- ▶ 9 of the 27 were discharged alive for a survival rate of **33%**

Survival of “Organized rhythms” which changed to PEA or Asystole

- ▶ Total Cohort was 41 patients
- ▶ Of these 41 patients, 21 (51%) survived to DC from the hospital

Survival by Arrest Rhythm

Survival by arrest rhythm: VF / VT

Presentin g rhythm	Number of survivors	Number Defibrillated over total cohort	Survival with Defibrillation

Summary : Overall Survival in Multnomah County 2009 (Jan-Oct)

Presenting rhythm	Survival to DC	Number of survivors
Survival of attempted resuscitation (N=393)	14%	55
Total of entire cohort (n=518)	10.6 %	55

Summary

- ▶ Survival from Sudden Cardiac Death appears to be improving since 2007-2008 in Multnomah County in spite of a marked decrease in percentage of VF arrests

Summary

- ▶ The primary change (improvement) from 2007 -2008 appears to be in patients who had “organized rhythm” upon presentation.
- ▶ Possible causes for this increase of survival may be **better CPR, ?? medications** (vasopressin and epinephrine), and **induced hypothermia**.

Summary

- ▶ Defibrillation remains key component but ONLY in 27 of the 55 survivors of OHCA in Multnomah County
- ▶ 90 / 393 (22%) of patients in whom resuscitation was attempted received defibrillation
- ▶ **The remainder of the survivors (28/55 50%) survived with “only CPR, ALS care and medications”.**

Summary

- ▶ There appears to be a significant number of patients presenting with PEA responding to field resuscitation.

Summary

- ▶ Other strategies need to be implemented for patients who have clinical presentations which are not responsive to defibrillation.

Summary

- ▶ Cardiac arrest survival appears to be multi-factorial and involves out of hospital interventions in conjunction with hospital interventions.

Summary

- ▶ It is unclear at this time the impact on the interventions, but it may require a combination of interventions including
- ▶ CPR (continuous)
- ▶ Defibrillation (when appropriate)
- ▶ Early ALS medications (EZIO) ??
- ▶ Rapid response times
- ▶ Hospital Care (induced hypothermia etc)

The END!

▶ Questions?

Intravenous drug administration during out-of-hospital cardiac arrest: a randomized trial

Compared with patients who received ACLS without intravenous drug administration following out-of-hospital cardiac arrest, patients with intravenous access and drug administration had higher rates of short-term survival with no statistically significant improvement in survival to hospital discharge, quality of CPR, or long-term survival.

- ▶ [Olasveengen TM](#), [Sunde K](#), [Brunborg C](#), [Thowsen J](#), [Steen PA](#), [Wik L](#). JAMA. 2009 Nov 25;302(20):2222-9.
-

Summary

- ▶ More timely outcomes are sorely needed to better assess the outcomes of the interventions we make in the field

Summary

- ▶ The good news is that it appears that we are moving in the right direction.

Intravenous drug administration during out-of-hospital cardiac arrest: a randomized trial.

- ▶ Compared with patients who received ACLS without intravenous drug administration following out-of-hospital cardiac arrest, patients with intravenous access and drug administration had higher rates of short-term survival with no statistically significant improvement in survival to hospital discharge, quality of CPR, or long-term survival.
- ▶ [Olasveengen TM](#) JAMA. 2009 Nov 25;302(20):2222-9.

Do advanced cardiac life support drugs increase resuscitation rates from in-hospital cardiac arrest? The OTAC Study Group.

- ▶ We found no association between standard ACLS medications and improved resuscitation from in-hospital cardiac arrest. Randomized clinical trials are needed to determine whether other therapies can improve resuscitation from cardiac arrest when compared with the presently used ACLS drugs.
- ▶ van Walraven Ann Emerg Med. 1998 Nov;32(5):544-53.

THE CHANGING INCIDENCE OF VENTRICULAR FIBRILLATION IN MILWAUKEE, WISCONSIN (1992--2002)

- ▶ Incidence of out-of-hospital VF/VT arrests decreased steadily from 37.1 per 100,000 in 1992 to 19.4 per 100,000 in 2002.
- ▶ Incidences of pulseless electrical activity and overall cardiac arrest remained unchanged, the incidence of asystole during the study period increased from 27.3/100,000 to 44.9/100,000.
- ▶ Mark S. Polentini, MD, MS Prehospital Emerg Care 2006; 10:52–60

Beta-blocker Use and the Changing Epidemiology of Out-of-Hospital Cardiac Arrest Rhythms

- ▶ There appears to be an association between beta blockers and the changing epidemiology of arrest rhythms, which may account for the increasing incidence of PEA and concomitant decrease in VF.
- ▶ Scott Youngquist, MD, MS Resuscitation. 2008 March ; 76 (3): 376–380.
