

Evolving Diagnostic Processes for Dispatch

Jeff Clawson, MD

International Academies of
Emergency Dispatch

Conflict of Interest

- Priority Dispatch Medical Director, CEO
- IAED Board of Trustees, Council of Standards, Certification Board
- Level of Conflict: About as much as Ghaddafi has in Libya this week
- No Medical Directors were harmed in the making of these diagnostics...

The Diagnostic Tools
provide...

New Evaluation & Treatment
Methods in Protocol Use

They say Paramedics don't
diagnose, but Dispatchers do...

What are Dispatch Diagnostics?

Micros vs. Macros

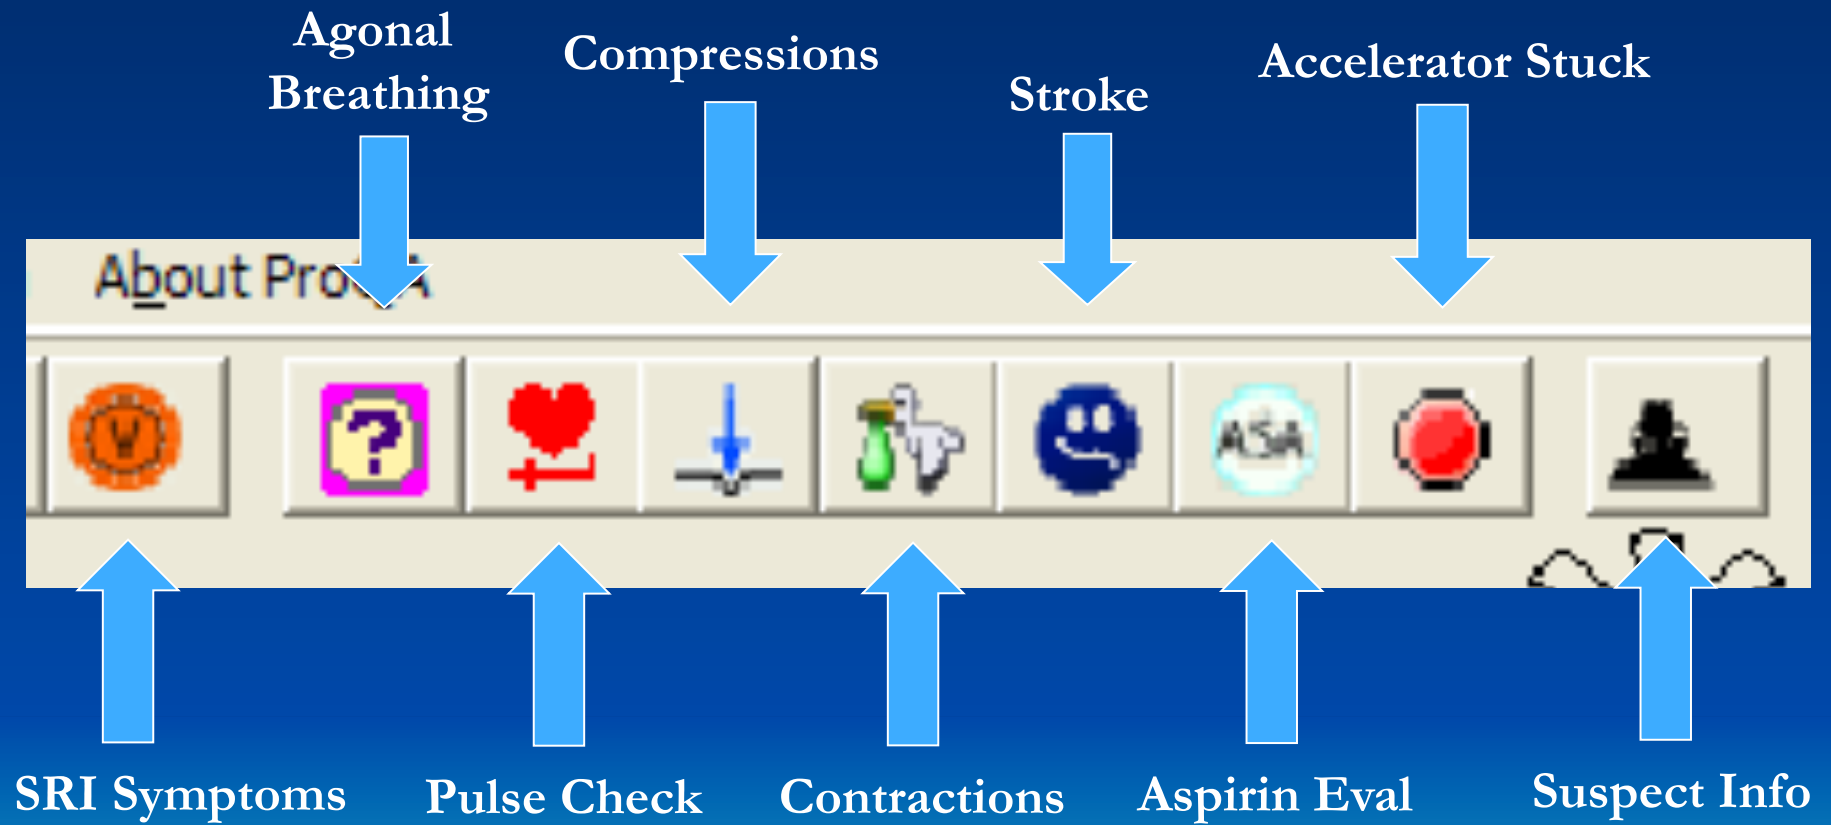

- Micros: a single Key Question searching for a single objective or finding
- Macros: a group of questions or evaluations searching for a single objective or finding and treating or rectifying that finding

EMDs have 9 Diagnostic Tools

- Agonal Breathing Detector
- Pulse Check
- Compressions Monitor
- Contractions Timer
- Stroke Diagnostic
- Aspirin Diagnostic & Instruction
- Accelerator Stuck & Can't Stop Vehicle
- Police Suspect Info Relay
- Severe Respiratory Infection (SRI) Symptoms
- Meningitis Identification Tool*
- Lost-Caller Locator Tool*

* In study testing now

Diagnostic Tool Icons for Rapid EMD Access

Agonal Breathing

- Often described as “gasping for air”
- Can look like a fish-out-of-water taking dying breaths
- How it sounds over the phone: 

Agonal Breathing

“The Great Pretender”

Agonal Breathing Detector

- “Pseudo” breathing in arrest situations can confound lay people and EMDs
- Just training appears to be insufficient to assure this caller observation is not misunderstood
- In 2004, the Academy Research Division added a direct counting process tool to identify both the rate and the effectiveness of breathing
- Ropollo, Idris, et al, published the effectiveness of agonal breathing counting at dispatch

Close

Pulse Check Tool

- Part of the manual protocol for **25 years**
- Provides **accurate timing** for the caller
- Easier **rate calculation** for the EMD
- New scientific study underway **to validate the accuracy** of this process**

****Mythbusters take on the concept that the layperson can't take a pulse**

Abbreviations

Additional Info

Limitations Warning

Pulse Check

Instructions for Taking a Pulse (select one):

Neck

Cord

(Read verbatim)

Find the Adam's apple on her/his neck.

Feel on either side of it for a pulse.

Be careful not to push too hard.

Count the pulses for 15 seconds.

I'll time you.

Clear/Restart

00:15

How many did you count?

Click caller's count at right.

Beats Per Minute

44

Compressions Monitor

- Based on **obvious difficulties** with callers performing accurate CPR rates on their own
- Also based on some EMDs **counting at an incorrect rate**
- Helps with **longer** 1st compressions periods – now at 600
- Timer help for the EMD – the **metronome**

202 cpm -- 1

We have calculated the rate to be:

Too Fast

Close

Contractions Timer

- Simplifies evaluation over an **extended time period**
- Eliminates an anxious **caller's "best guess"** error
- For a patient with a 5-minute contraction interval, timing a single interval can take from **5:01 to 9:59 minutes** to actually time it out
- Accounts for differences between **1st and 2nd plus** pregnancy imminent births situations
- Under consideration for **starting earlier at the point of Chief Complaint determination**

Abbreviations

Stroke Identification Icon

Droopy-Mouth Face

Brain Attack!

This
concept
has gotten
dispatch's
attention...

Earliest Point in the System

- EMDs are the **first, first responders** – they are there the second the phone stops ringing – **Zero Response Time**.
- They are trained to **precisely use a protocol** to evaluate and give care.
- It's like they are there, just **via remote control**.
- “Listen, I’ll tell you **exactly** what to do next...”

Stroke Diagnostic Tool

- Before 2004, Stroke Protocol selection was based on **Chief Complaint selection only**
- **Expansion of Determinant Response Codes** following the emergence of “Brain Attack” science
- San Diego study showed remarkably that EMDs had **twice the sensitivity** of paramedics in recognizing strokes: 83% to 44%
- The Tool establishes a **detailed EMD evaluation** process based on commonly used tests which can be **mathematically adjusted** to increase prediction based on outcome

Stroke Diagnostic Tool

I want you to get close enough to ask her/him three questions.
Tell me when you're ready.

Ready

Ask her/him to smile.

Answer
Selected

(Wait) Was the smile **equal** on **both sides** of her/his mouth?

- ☐ Normal smile
- ☒ Slight difference in smile (possible difference)
- ☐ Only one side of mouth or face shows a smile (obvious difference)
- ☐ Cannot complete request at all

2

Ask her/him to raise both arms above her/his head.

(Wait) What was s/he able to do?

- ☐ Both arms raised equally
- ☒ One arm higher than other (both raised unequally)
- ☐ Only one arm raised
- ☐ Cannot complete request at all

2

➔ Ask her/him to say, "The early bird catches the worm."

(Wait) Was s/he able to repeat it correctly?

(Clarify) Was it **slurred**, **garbled**, or not understandable?

- ☐ Said correctly
- ☒ Slurred speech
- ☐ Garbled or not understandable speech
- ☐ Cannot complete request at all

Aspirin Diagnostic & Evaluation Tool Icon

Aspirin Dx & Instruction Tool

- Aspirin proven to **reduce the extent and effects** of heart attack victims if used early
- Established due to **strong evidence-based** recommendations of the Resuscitation Councils (ILCOR) – especially the AHA
- Optional – based on **Medical Director approval** (this concern seems to be lessening)
- Now used in approximately **80%** of all version 12 (current) MPDS centers (about 2,000 centers)
- In first 2 years, we estimated a total **reduction of 114 years** of patients waiting for aspirin

1a -- Get Car into Neutral (Automatic)

Okay, **shift** into **neutral** or "N" now.

→ Unable to Shift

In Neutral

Unable to Shift

In Neutral

Critical ED Information

- * Some vehicles require **pushing a button** on the **side** of the **shift handle** with your **thumb** to **allow shifting** to neutral.
- * A **standard key ignition** must be turned off **only** as far as the **ACC position**, which **shuts down** the engine but **not** the **lights** and **accessories** (like when you want the radio still on).
- * **Turning off** the ignition to the **ACC position** will **change** the brakes and steering to **manual mode**. They should **still work**, but will be somewhat **stiffer than normal** (harder to turn and press the brake).
- * In **no case** advise them to **remove** the **key** from the **ignition until** the vehicle is **stopped**.
- * **Do not encourage** them to **either exit** the vehicle **or remain in** the vehicle.

4 -- Standard Key Ignition

Turn the **ignition key** just **one click** back (ACC position) so that the engine **shuts off** but it **doesn't lock** your **steering wheel**.

Turning off the ignition will **change** the power brakes and steering to **manual mode**. They should **still work**, but will be somewhat **stiffer than normal** (harder to turn and press the brake).

Caller Locator Dx Tool

- Callers in various forms of distress may **not be able** to identify their location
- This may be due to several factors:
 - No noticeable address/location identifiers
 - No ANI/ALI (waiting for NG911 Phase 2)
 - Inability to speak or be clearly understood
 - Due to stroke
 - Extreme difficulty breathing
 - Drug effects on cognition, etc.
