

The slide features two large, abstract green geometric shapes. On the left, a light green triangle points upwards. On the right, a darker green rectangle is partially visible, with a light green triangle pointing downwards from its bottom-left corner. Thin white lines intersect these shapes, creating a dynamic background.

Shocking Results: How Accurate is Paramedic ECG Analysis in Cardiac Arrest?

HIGHEST IMPACT CARDIAC ARREST INTERVENTIONS

Inter-Rater Agreement of Paramedic Rhythm Labeling

From the Department of Emergency Medicine, William Beaumont Hospital, Royal Oak, Michigan; and Section of Emergency Medicine, Department of Surgery, University of Michigan, Ann Arbor.†*

Received for publication August 18, 1992. Revision received December 14, 1992. Accepted for publication January 7, 1993.

Presented at the Society for Academic Emergency Medicine Annual Meeting in Toronto, Ontario, Canada, May 1992.

Study hypothesis: Substantial inter-rater agreement is present in the labeling by paramedics of ventricular fibrillation and asystolic rhythms.

Design: Prospective, cross-sectional study.

Type of participants: One hundred five practicing paramedics from nonvolunteer agencies who are advanced cardiac life support certified.

Methods: Five static cardiac arrest rhythm strips, classified by Cummins' average peak amplitude method, were arranged into five different orders of presentation and placed into five booklets. The paramedics were instructed to label each rhythm ventricular fibrillation or asystole based on rhythm recognition, not on treatment plan.

Results: The overall κ value for labeling the five rhythms was .63, indicating a moderate degree of inter-rater agreement. However, as the rhythm's amplitude decreased, the amount of

26 (19%) Asystole
12 (9%) Shockable
4 (3%) Unknown

SUMMARY

- ▶ Paramedics have high case sensitivity for shockable rhythms
 - ▶ Consider empiric shock for perceived asystole
- ▶ Delayed defibrillation is frequent and occurred ~30% of the time in ALS care
- ▶ Our future areas of focus:
 - ▶ limiting delays in defibrillation

In a setting of continuous review and feedback

CAVEATS

- ▶ Gold Standard is single reviewer (me!)
- ▶ Paramedics instructed to monitor filtered rhythm for VF recurrence and administer shock without waiting
- ▶ Pit Crew approach with 6-8 hands
- ▶ Includes period in which empiric shock of asystole protocolized
- ▶ Excluded epochs in which rhythm couldn't be determined
- ▶ Used interpolation of last visualized rhythm in some cases
